Prior to the development of the system, I helped my group create the entity relationship diagram by establishing the relations needed to create the database. I also joined brainstorming sessions with my group in deciding what programming language to use and establish the general architecture to be used for our system. With regards to the related documents for this project, I also helped in proofreading the content as well as verifying that the content is correct and accurate.

During the development of the project, I am the secondary developer of the backend of the system. I developed some of the CRUD functionalities related to the creation of nurse accounts. When the requirements of the client arrived, I helped in establishing some of the logic to be created with the main backend developer on my group, Ms. Kimberly Anchuvas.
